T21667

hypothetical protein F32G8.3 - Caenorhabditis elegans
C;Species: T21667
R;McMurray, A.
Submitted to the EMBL Data Library, May 1996
A;Reference number: Z19456
A;Reference number: Z19456
A;Retexosion: T21667
A;Status: preliminary; translated from GB/EMBL/DDBJ

A; Molecule type: DNA

A;Residues: 1-129 <WIL>
A;Cross-references: EMBL:272509; PIDN:CAA96647.1; GSPDB:GN00023; CESP:F32G8.3
A;Experimental source: clone F32G8
C;Genetics:

A; Gene: CESP:F32G8.3 A; Map position: 5 A; Introns: 22/3; 73/3

Natl. Acad. Sci. U.S.A. 83:8634-8638 (1986).

1- FUNCTION: SPECIES-SPECIFIC SEA URCHIN SPERM PROTEIN REQUIRED FOR ADHESION OF SPERM TO THE EGG SURFACE DURING FERTILIZATION. BINDIN COATS THE ACROSOME PROCESS AFTER IT IS EXTERNALIZED BY THE ACROSOME REACTION. IT BINDS TO SULFATED, FUCOSE-CONTAINING POLYSACCHARIDES ON THE VITELLINE LAYER RECEPPIOR PROTEOGLYCANS WHICH COVER THE EGG PLASMA MEMBRANE.

-1-SUBUNIT: HETEROTETRAMER OF TWO TYPE I AND TWO TYPE II KERATINS.
-1-TISSUE SPECIFICITY: EXPRESSED IN THE TERMINALLY DIFFERENTIATED

EPIDERMIS OF PALMS AND SOLES.
-1-DISEASE: DEFECTI N KRT9 ARE A CAUSE OF EPIDERMOLYTIC PALMOPLANTAR

KERATOBERMA (EPPK), AN AUTOSOMAL DOMINANT DISEASE CHARACTERIZED BY

DIFFUSE THICKENING OF THE EPIDERMIS ON THE ENTIRE SURFACE OF

PALMS AND SOLES SHARPLY BORDERED WITH ERYTHEMATOUS MARGINS.
-1-MISCELLANBOUS: THERE ARE TWO TYPES OF CYTOSKELETAL AND

MICROFIBRILLAR KERATIN: I (ACIDIC; 40-55 kDa) [K9 TO K20] AND II

(NEUTRAL TO BASIC; 56-70 kDa) [K1 TO K8].
-1-SIMILARITY: BELONGS TO THE INTERMEDIATE FILAMENT FAMILY.
-1-CAUTION: WAS ORIGINALLY (REF.2) THOUGHT TO BE A 60 kDa CHAIN OF Covello S.P., Irvine A.D., McKenna K.E., Munro C.S., Nevin N.C., Smith F.J.D., Uitto J., McLean W.H.I.;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Isolated nucleic acids and polypeptides, useful for preventing

```
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to sytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, mematopolesis regulating activity, issue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; primer; detection; diagnosis; antisense therapy; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
```

The present invention describes primer sets for synthesising 5602

```
comprises: (a) an oligo-dT primer and an oligonucleotide complementary comprises: (a) an oligo-dT primer and an oligonucleotide complementary strand of a polynucleotide which comprises one of the complementary strand of a polynucleotide which comprises one of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the comprises a 1'-end sequence, where the coligonucleotide which comprises a 3'-end sequence, where the coligonucleotide which comprises a 1'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the contains and AAH13633 to AAH13612 represent human cDNA sequences; AAB92446 to AAH13632 to AAH13632 to AAH13632 to AAH13632 to Contain and the contains and AAH13632 to Contain and the contains and also contains and al

polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymoclecities are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical maging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                               and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      91.7%; Score 33; DB 22; Length 972;

polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymorleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving containing antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating clasorders involving aberrant protein expression or biological activity. The polypeptide and polymorlectide sequences have applications in diagnostics, forgenetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human confusions to the sequence and for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the .invino.int/Pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AA013910) that exhibit activity elating to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The Invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nematopoiesis regulating activity, issue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or
               production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity infinibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                               Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WiPO at ftp.wipo.int/pub/published_pct_sequences.
 cell proliferation or cell differentiation or which may induce

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sutB gene; sulphate permease; sulphur transporter; expression cassette; S-containing beta lactam precursor; beta lactam producing organism; beta lactam compound; penicillin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                   Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; SEQ ID NO 17385; 21pp + Sequence Listing; English

polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; bromine group domain 11; cancer; haemopathy; HIV infection;
                                                                                                                                                               New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          22; Length 62;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            comprising a sulphate permease for sulphate uptake across the cellular membrane. This controls the flux of S-containing beta lactam precursors an expression cassette containing the polynucleotide operably linked to regulatory sequence can be used to transform a beta lactam producing organism. Transformed cells show an increased production of the beta lactam compound. This is used in the control of the regulation and expression level of sulphate transporters, in order to influence the production level of penicillin and other beta lactams.
                                                                                                                                                                                                                                                                                                                                                                    Driessen AJM, Turner G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their
                                                           group domain 11 for diagnosing and treating malignant /, human immunodeficiency virus infection, immunological
                                                                                                                                  The present invention provides the protein and coding sequences of humz bromhe group domain 11. The sequences can be used in the treatment of cancer, haemopathy, HIV infection, immunological diseases and inflammation. The present sequence is the protein of the invention.
                                                                                                                                                                                                                          Score 31; DB 22; Length 96;

activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the examplification of the present invention.

N. B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,

The specification describes human secreted proteins. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating medical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the amount of the polynucleotides. Specific uses are described for each of mutations in the polynucleotides. Specific uses are described for each of the polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegencrative disorders, developmental abnormalities and fetal deficiencies, blood disorders, leukemias, can diseases of the immune system, autoimmune diseases, hepatic and renal diseases of the immune system, autoimmune diseases, hepatic and renal diseases, lymphomas, inflammation, alleringies, ischemic shock, Alzheimer's and cognitive disorders, schizophrenia, prostate diseases, obesity, disorders involving osteoclasts such as osteoporosis, arthritis or alliannancies, diseases of testes, lung or thymus, disestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners.
                                                                                                                         New isolated human genes and the secreted polypeptides they encode

This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polyeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in manns and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus. products for the diagnosis, prevention and treatment of diseases caused by Borrelia, particularly Lyme disease Claim 12; Page 75; 275pp; English, 123 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

SUBUNIT: THE 26S PROTEASOME IS COMPOSED OF A CORE PROTEASE, KNOWN AS THE 20S PROTEASOME, CAPPED AT ONE OR BOTH ENDS BY THE 19S REGULATORY COMPLEX (RC). THE RC IS COMPOSED OF AT LEAST 18 DIFFERENT SUBUNITS IN TWO SUBCOMPLEXES, THE BASE AND THE LID, WHICH FORM THE PORTIONS PROXIMAL AND DISTAL TO THE 20S PROTEOLYTIC CORE, RESPECTIVELY (BY SIMILARITY).

SIMILARITY: BELONGS TO THE PROTEASOME SUBUNIT S3 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EMBL; D78023; BAA11208.1; -.
